

Session:15

1. safe_divide(a, b)

```
def safe_divide(a, b):
    try:
        return a / b
    except ZeroDivisionError:
        return "Cannot divide by zero"

# Example
print(safe_divide(10, 2)) # 5.0
print(safe_divide(10, 0)) # Cannot divide by zero
```

2. Zomato-style rating system

```
try:
    reviews = int(input("Enter number of reviews: "))
    stars = int(input("Enter total stars: "))

    average_rating = stars / reviews
    print("Average rating:", average_rating)

except ValueError:
    print("Error: Please enter numeric values only.")
except ZeroDivisionError:
    print("Error: Number of reviews cannot be zero.")
```

3. get_playlist_duration(songs)

```
class InvalidDurationError(Exception):
    pass

def get_playlist_duration(songs):
    total_seconds = 0

    for duration in songs:
        if duration < 0:
            raise InvalidDurationError("Duration cannot be negative")
        total_seconds += duration

    return total_seconds / 60

# Example
try:
    print(get_playlist_duration([180, 240, 300])) # 12.0 minutes
    print(get_playlist_duration([200, -50, 100])) # Raises error
```

```
except InvalidDurationError as e:  
    print("Error:", e)
```

4. Flipkart-style order summary

```
try:  
    price = float(input("Enter item price: "))  
    quantity = int(input("Enter quantity: "))  
  
except ValueError:  
    print("Invalid input! Please enter numbers correctly.")  
  
else:  
    total = price * quantity  
    print("Total price:", total)  
  
finally:  
    print("Thank you for shopping!")
```

5. AI-generated division code + learning

Code:

```
try:  
    a = float(input("Enter first number: "))  
    b = float(input("Enter second number: "))  
  
    result = a / b  
    print("Result:", result)  
  
except ZeroDivisionError:  
    print("Error: Cannot divide by zero.")  
except ValueError:  
    print("Error: Please enter valid nu
```
