

Session:19

1. Song class with constructor

```
class Song:
    def __init__(self, title, artist, duration):
        self.title = title
        self.artist = artist
        self.duration = duration # in seconds
```

2. Create object and print title & artist

```
song = Song("Blinding Lights", "The Weeknd", 200)

print("Title:", song.title)
print("Artist:", song.artist)
```

3. Add play_preview() method

```
class Song:
    def __init__(self, title, artist, duration):
        self.title = title
        self.artist = artist
        self.duration = duration

    def play_preview(self):
        print(f"Playing 30-second preview of {self.title} by {self.artist}")
```

Call method:

```
song = Song("Blinding Lights", "The Weeknd", 200)
song.play_preview()
```

4. FoodOrder class (Zomato-like example)

```
class FoodOrder:
    def __init__(self, restaurant_name):
        self.restaurant_name = restaurant_name
        self.items = []
        self.total_price = 0

    def add_item(self, item, price):
        self.items.append(item)
        self.total_price += price
```

Demo:

```
order = FoodOrder("McDonald's")

order.add_item("Burger", 150)
order.add_item("Fries", 80)

print("Restaurant:", order.restaurant_name)
print("Items:", order.items)
print("Total Price:", order.total_price)
```

5. Song class with play_count feature

```
class Song:
    def __init__(self, title, artist, duration):
        self.title = title
        self.artist = artist
        self.duration = duration
        self.play_count = 0

    def play_preview(self):
        print(f"Playing 30-second preview of {self.title} by {self.artist}")

    def increment_play_count(self):
        self.play_count += 1
```

Demo usage:

```
song = Song("Shape of You", "Ed Sheeran", 240)

song.increment_play_count()
song.increment_play_count()
song.increment_play_count()

print("Song:", song.title)
print("Play count:", song.play_count)
```
