

Session:2

1. Create Variables: `user_name`, `fav_app`, and `daily_usage_hours`

```
# User details
user_name = "Rahul"
fav_app = "Instagram"
daily_usage_hours = 3

print("Name:", user_name)
print("Favorite App:", fav_app)
print("Daily Usage Hours:", daily_usage_hours)
```

2. Flipkart Product Variables and Data Types

```
# Product information
product_name = "Wireless Earbuds"
price = 1499.99
is_available = True

# Print values and data types
print(product_name)
print(type(product_name))

print(price)
print(type(price))

print(is_available)
print(type(is_available))
```

Sample Output

```
Wireless Earbuds
<class 'str'>

1499.99
<class 'float'>

True
<class 'bool'>
```

3. Single-Line and Multi-Line Comments (Spotify Recommendation System)

```
# Spotify recommendation system
```

```
# Collect user's listening history
# Analyze favorite genres and artists
# Recommend similar songs and playlists

"""
This is a multi-line comment.

A Spotify playlist recommendation system might:
1. Track songs played by the user.
2. Identify preferred genres and artists.
3. Compare user preferences with similar users.
4. Suggest personalized playlists and new tracks.
"""

print("Spotify Recommendation System Example")
```

4. Zomato Order Variables and Formatted Output

```
# Zomato order details
order_total = 850
delivery_region = "Ahmedabad"
discount_percent = 20

print(
    f"Order from {delivery_region} totals ₹{order_total} with {discount_percent}% discount."
)
```

Sample Output

```
Order from Ahmedabad totals ₹850 with 20% discount.
```

5. Mixing Tabs and Spaces (Error Example and Fixed Version)

Incorrect Code (Causes Indentation Error)

```
if True:
    print("This line uses a tab")
    print("This line uses spaces")
```

The code above mixes tabs and spaces for indentation, which can result in:

```
TabError: inconsistent use of tabs and spaces in indentation
```

Corrected Code

```
if True:
    print("This line uses spaces")
    print("This line also uses spaces")
```

Output

```
This line uses spaces
This line also uses spaces
```
