

Session:21

1. Product and Electronics (Method Overriding)

```
class Product:
    def get_discount(self):
        return 0

class Electronics(Product):
    def get_discount(self):
        return 10

# Test
p = Product()
e = Electronics()

print("Product discount:", p.get_discount())
print("Electronics discount:", e.get_discount())
```

2. FoodOrder and ZomatoOrder (Inheritance + Override)

```
class FoodOrder:
    def __init__(self, base_price):
        self.base_price = base_price

    def calculate_total(self):
        return self.base_price

class ZomatoOrder(FoodOrder):
    def calculate_total(self):
        return self.base_price + (self.base_price * 0.05)

# Test
order = FoodOrder(1000)
z_order = ZomatoOrder(1000)

print("FoodOrder total:", order.calculate_total())
print("ZomatoOrder total:", z_order.calculate_total())
```

3. Polymorphism with show_bonus()

```
class Influencer:
    def bonus(self):
        return 2000
```

```
class BrandManager:
    def bonus(self):
        return 5000

def show_bonus(employee):
    print(employee.bonus())

# Test
i = Influencer()
b = BrandManager()

show_bonus(i)
show_bonus(b)
```

4. User and PremiumUser (Method Override)

```
class User:
    def get_status(self):
        return 'active'

class PremiumUser(User):
    def get_status(self):
        return 'premium'

# Test
u = User()
pu = PremiumUser()

print("User status:", u.get_status())
print("PremiumUser status:", pu.get_status())
```
