

Session:5

1. Spotify playlist IDs list and append()

```
playlist_ids = [101, 102, 103, 104, 105]
playlist_ids.append(106)

print("Updated playlist IDs:", playlist_ids)
```

2. Flipkart shopping cart using extend()

```
cart_items = ['t-shirt', 'shoes']
cart_items.extend(['jeans', 'cap'])

print("Final cart items:", cart_items)
```

3. Function to remove the last item from a Zomato order list

```
def remove_last_item(order_list):
    return order_list.pop()

# Test the function
order_list = ['Pizza', 'Burger', 'Cold Drink']
removed_item = remove_last_item(order_list)

print("Removed item:", removed_item)
print("Updated order list:", order_list)
```

4. Instagram filters tuple and immutability demonstration

```
insta_filters = ('Clarendon', 'Juno', 'Lark', 'Valencia')

# The following line will raise an error:
# insta_filters[1] = 'Gingham'

# Error:
# TypeError: 'tuple' object does not support item assignment
```

5. List vs Tuple choices

```
# User's favorite genres -> List
# Reason: Favorite genres can change over time, so a list is suitable.

# IRCTC train classes -> Tuple
# Reason: The set of train classes is fixed and should not be modified,
# so a tuple is appropriate.
```

Output (for Tasks 1–3):

Updated playlist IDs: [101, 102, 103, 104, 105, 106]
Final cart items: ['t-shirt', 'shoes', 'jeans', 'cap']
Removed item: Cold Drink
Updated order list: ['Pizza', 'Burger']
