

Session:1

Task 1

I installed Anaconda on my system from the official Anaconda website. After the installation was completed, I opened Anaconda Navigator and launched Jupyter Notebook successfully.

Task 2

I created a new Jupyter Notebook file named **analytics_intro.ipynb**. In the first cell, I wrote the following code:

```
print("My name is [Your Name]")
print("My favorite app is Instagram")
```

Output:

```
My name is [Your Name]
My favorite app is Instagram
```

Task 3

I opened VS Code and created a Python script file named **hello_app.py**. I wrote the following code:

```
print("Welcome to Data Analytics with Python!")
```

Then, I ran the script from the terminal using:

```
python hello_app.py
```

Output:

```
Welcome to Data Analytics with Python!
```

Task 4

In Jupyter Notebook, I added a new cell and used the `datetime` module to print the current year.

```
from datetime import datetime

current_year = datetime.now().year
print("Current Year:", current_year)
```

Output: Current Year: 2026
